

Indaten®

Purple-brown, finely grained, Indaten® owes its success thanks to its wonderful patina. When exposed to the natural environment, a protective oxide layer forms on the surface. This oxidation process is obtained through the addition of a very small percentage of copper, nickel and chromium in the steel. Once the oxidation is stabilised, the patina constitutes a protective barrier. No maintenance is necessary and the material will not degrade through corrosion.

Very popular with architects for achievement in harmony with environment, its visual impact is guaranteed.

Indaten® is only available on cassette MD.
