

Cofrasol 40

Cofrasol 40 floor decking serves only as formwork during the concrete pouring and hardening. The resistance of the profile is therefore limited to this construction phase. It is not considered for the calculation of the resistance of the final slab.

- Cofrasol steel profiles serve as formwork while for the construction of a reinforced concrete slab
- The floor decking is self-bearing but does not contribute to the structural resistance of the final reinforced concrete slab
- The metal sheet permits to construction concrete slabs where the access of normal shuttering is difficult
- No need to remove formwork after concreting resulting in time savings
