

Supportsol® 74

The Supportsol® 74 dry floor system is based on a trapezoidal profile combined with a wooden plate screwed onto the sheet. The wood panel stabilizes the dry floor system and provides the necessary rigidity to the construction to ensure the load bearing capacity.

- The dry floor allows spans between 1.5 and 3.0m
- Is a lightweight construction with a self-weight of 8.9 to 14.9kg/m²
- Allowable loading greater than 1 ton
- System width: 856mm
- Does not require any fresh concrete
- Metallic floor supplied without the wooden panel
